Editorial

Last year, to commemorate the 32nd International Geological Congress in Florence, a special issue of Przegląd Geologiczny 8/2 (Geological Review) has been published entirely in English. It has been warmly welcomed by the readers and helped to promote knowledge of the geological structure of Poland and its particular regions among foreign Earth Sciences professionals. This favourable reception motivated us to follow up with another special English issue of our journal. We have decided to devote it to various aspects of geological cartography — one of the main activities of national geological surveys. Since in Poland the functions of the geological survey are performed by the Polish Geological Institute, most papers are authored by scientists from the PGI in Warsaw and from its regional branches. Nevertheless, other institutions involved in cartographic work, including universities, are also represented. We hope that current issue of Przegląd Geologiczny (Geological Review) will be also met with interest by geologists from abroad, so that we can continue to publish regularly each year an English-language special edition focused on selected topics.
